Interaction trap systems using conformationally-constrained proteins - useful for detection of protein interactions and for identification and isolation of interacting proteins.

Claim 66; Page 60; 73pp; English.

interaction trap assay using conformationally-constrained by an interaction trap assay using conformationally-constrained proteins. The assay comprises providing a host cell (esp. a yeast cell) which contains: (i) a reporter gene operably linked to a DNA-binding protein recognition site, pref. LexA, (ii) a 1st fusion gene expressing Cdk-2 covalently bonded to a LexA binding protein, and (iii) a 2nd fusion gene expressing a conformationally-constrained (pref. with thioredoxin) protein (either expected to interact with Cdk-2 or a random peptide) covalently bonded to a gene-activating moiety, and measuring expression of the reporter gene as a measure of interaction between Cdk2 and the conformationally constrained protein. The same system may be applied to find proteins that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aptamers AAW32116-W32132 have been isolated from a peptide library and are used in a novel interaction trap method for detecting protein the interactions and isolating novel proteins. The method involves a host cell containing a reporter gene operably linked to a DNA-binding-protein (DBP) recognition site, a fusion gene capable of expressing a fusion gene capable of expressing a fusion protein which is able to specifically bind to the DBP recognition site of and a second fusion gene which expresses a second fusion protein which is conformationally constrained and bonded to a gene activating moiety.

Measuring expression of the reporter gene gives a measure of the conformation between Pl and P2. This method can be used to identify agonists or antagonists for use as therapeutic molecules or for the design of simple molecule mimetics. The method is specifically used to detect an interacting protein in a population of proteins or to identify a candidate interactor. Using conformationally constrained proteins conformationally constrained proteins can provide for tertiary structural analysis and can also proteins conformation of the candidate interactor to increase the protein's solubility, incorrect provide to increase the protein's conformation in the capacity of the candidate interactor to
                                                                                             0;
interact with any other protein of interest (e.g. Ras) or proteins having agonist or antagonist activity on such interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New trap system for detecting protein interactions - comprises a reporter gene linked to a DNA-binding-protein recognition site and fusion proteins to test for interactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a process for specifically modulating the properties of an intracellular target molecule T, and/or of a cellular component C which interacts directly or indirectly in a cell with the target. The process involves the introduction into the cell of chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, myopathies, genetic disorders, metabolic disorders, psychiatric disorders, myopathies, genetic disorders, cardiovascular disorders and dental disorders. The present sequence is a mutant of a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Intracellular target; cellular component; property modulation; antimicrobial; immunomodulatory; nootropic; neuroprotective; metabolic; neuroleptic; cytostatic; cardiant; infection; immunological disorder; neurological disorder; metabolic disorder; psychiatric disorder; myopathy; cancer; cardiovascular disorder.

The present invention relates to a process for specifically modulating the properties of an intracellular target molecule T, and/or of a cellular component C which interacts directly or indirectly in a cell with the target. The process involves the introduction into the cell of chimeric molecule known as a targeted effector, comprising a recognition moiety capable of recognising T and an effector moiety. The chimeric protein or nucleic acid can be used in the preparation of a medicament for the treatment of microbial infections, immunological disorders, neurological disorders, metabolic disorders, psychiatric disorders, neurological disorders, cardiovascular disorders and dental disorders. The present sequence is a known anti-Cdk2 aptamer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                            Process for specifically modulating the properties of an intracellular target molecule used for the treatment of various disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging convolvesphide and polynucleotide sequences have applications in the purposable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the vivial patences.
               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genome; cyanophage; 2; 6-diaminopurine; chemotherapy; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Galisson F, Bouzon M, Robert C, Vico V;

```
The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polymucleotides containing these bases, polymerases involved in metabolism of D-bases and decoxpucleotide analogs, for chemotherapy of AIDS. The genes, and encoded polypeptides, on be used for detection and/or identification of S-2L, and for identifying agents that modulare synthesis of D-bases or polymucleotides containing them, and fusions of S-2L polypeptides with an antigen can be used to raise specific anibodies, useful for detecting S-2L. This sequence corresponds to one of the proteins encoded by the cyanophage S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Altering seed characteristics for producing transgenic plants by introducing into a plant cell a recombinant expression cassette having a polynucleotide that alters the number, type and configuration of aleurone
genomic sequence for cyanophage S-2L, useful for identifying genes synthesis of 2,6-diaminopurine bases or polynucleotides containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for altering seed characteristics. The method comprises introducing (into a plant cell) recombinant expression cassette comprising a polymucleotide whose expression, alone and in combination with additional polymucleotides,
                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gruis DB;

The present invention relates to a method for altering seed characteristics. The method comprises introducing (into a plant cell) a recombinant expression cassette comprising a polynucleotide whose expression, alone and in combination with additional polynucleotide is alters the number, type and configuration of aleurone cells within seed, (the polynucleotide is operably linked to a promoter). The method is useful for altering seed characteristics to produce a transgenic having seeds and grains with improved nutritional, industrial and agricultural traits. The present sequence is Arabidopsis thaliana DEK1, which was used to illustrate the invention. The Dek1 protein is involved in aleurone
                                                                                                                                                                                         0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Altering seed characteristics for producing transgenic plants by introducing into a plant cell a recombinant expression cassette having a polynucleotide that alters the number, type and configuration of aleurone cells within seed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Plant; seed; grain; aleurone cell; transgenic plant; gene therapy; dekl; aleurone cell differentiation.
alters the number, type and configuration of aleurone cells within seed, (the polynucleotide is operably linked to a promoter). The method is useful for altering seed characteristics to produce a transgenic having seeds and grains with improved nutritional, industrial and agricultural traits. The present sequence is the protein sequence for calpain, which was used to illustrate the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Altering seed characteristics for producing transgenic plants by introducing into a plant cell a recombinant expression cassette having a polynucleotide that alters the number, type and configuration of aleurone
                                                                                                                                                                                                              Plant; maize; seed; grain; aleurone cell; transgenic plant; gene therapy; dekl; aleurone cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for altering seed characteristics. The method comprises introducing (into a plant cell) a recombinant expression cassette comprising a polynucleotide whose expression, alone and in combination with additional polynucleotides, alters the number, type and configuration of aleurone cells within seed, (the polynucleotide is operably linked to a promoter). The method is useful for altering seed characteristics to produce a transgenic having seeds and grains with improved nutritional, industrial and agricultural traits. The present sequence is maize DEK1 from B73, which was used to illustrate the invention. The DEK1 protein is involved in aleurone cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to the isolation of novel human respiratory antigens, and cDNA (AAS27869-AAS28159) and genomic sequences encoding for these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the tespiratory system including throat disorders (e.g. vocal cord paralysis, tonsillitis, and laryngitis), lung disorders e.g. pneumonia, allergic disorders and cancers of the respiratory tissues e.g. pneumonia, allergic polynucleotide sequences of the invention are useful in gene therapy and antisense therapy. AAUT/865-AAUT/975 represent novel human respiratory antisense therapy. AAUT/865-AAUT/975 represent novel human respiratory antisense therapy. ALU-869-dence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human respiratory system associated polynucleotide; respiratory system disorder; throat disorder; vocal cord paralysis; tonsillitis; laryngitis; lung disorder; pneumonia; allergic disorder; asthma; cosinophilic pneumonia; pleurisy; cystic fibrosis; emphysema; histiocytosis; sarcoidosis; nose disorder; rhinitis; sinusitis; neoplasm; cancer; respiratory tissue cancer; throat cancer; lung cancer; cancer of the nose; gene therapy; chromosome identification; forensic;
                                                                                                                                                                                                                                                                                                             Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the respiratory system including respiratory cancers and also for testing and detection e.g. diagnosis.

acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of RS, full-length protein of PS, or variant, allelic variant or species homolog of PS. (I) protein of PS, or variant, allelic variant or species homolog of PS. (I) or a polymucleotide (II) encoding (I) is also useful for diagnosing a certain produced condition or a usceptibility to a pathological condition in a subject which involves determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a biological sample and diagnosing a pathological condition based on the result. The human respiratory system associated polymucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders (e.g., vocal cord paralysis, tonsillitis, and laryngitis), lung disorders (e.g., pneumonia), plantisy, cystic fibrosis, emphysema, histicoytosis, concerned is ancerned cancer, lung cancer, and cancer of the nose). The polymucleotides are useful in gene therapy
                                                                                                                                                                                                                                                                    The invention describes an isolated polypeptide (I) comprising an amino
                                                                                                                                           Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat

Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics,
                                         New genomic sequence for cyanophage S-2L, useful for identifying genes for synthesis of 2,6-diaminopurine bases or polynucleotides containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 25051; 455pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
The invention relates to the entire genome of cyanophage S-2L, and to the protein encoded by it. Genes isolated from the genome of S-2L are useful for preparing enzymes for synthesis of D-bases (D = 2,6-diaminopurine), particularly D, dDMP and dDTP, or polymucleotides containing these bases, polymerases involved in metabolism of D-bases and deoxymucleotide can long for detection and/or identification of S-2L, and for identifying agents that modulate synthesis of D-bases or polymucleotides containing them, and fusions of S-2L polypeptides with an antigen can be used to raise specific antibodies, useful for detecting S-2L. This sequence corresponds to one of the proteins encoded by the cyanophage S-

prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa mucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis andor treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                               ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging
                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

CC of sites expressing (II). (I) and (II) are useful for treating disorders convolving aberrant protein expression or biological activity. The polypeptide and polynuclocide sequences have applications in diagnostics, forenaics, gene mapping, identification of mutations of responsible for genetic disorders or other traits to assess biodiversity or and to produce other types of data and products dependent on DNA and common acid sequences of the invention. Note: The sequence data for this control amino acid sequences of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 31470, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILLS OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILLS REPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
PRICR APPLICATION NUMBER: US 60/074,788
PRICR FILLING DATE: 1999-02-18
PRICR FILLING DATE: 1998-02-18

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N;Contains: major surface antigen; middle surface antigen
C;Species: woodchuck hepatitis virus
C;Species: woodchuck hepatitis virus
C;Accession: D2969
R;Cohen, JI.; Miller, R.H.; Rosenblum, B.; Denniston, K.; Gerin, J.L.; Purcell, R.H.
Virology 162, 12-20, 1988
A;Titler: Sequence comparison of woodchuck hepatitis virus replicative forms shows conser A;Reference number: A94368; MUID:88101359; PMID:3336938
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           C; Keywords: gjycoprotein; surface antigen (gene pre-S2/S) #status predicted <DSA>F;150-431/Product: middle surface antigen (gene S) #status predicted <MSA>F;210-431/Product: major surface antigen (gene S) #status predicted <MSA>F;32,94,152/Binding site: carbohydrate (Asn) (covalent) #status predicted

                                                                                                                                                                                                                                                                                                                                                                     Accession: 1282 Acres on tigen precursor - woodchuck hepatitis virus (clone 64)

Middle surface antigen precursor - woodchuck hepatitis virus (clone 64)

N; Contains: major surface antigen
C; Species: woodchuck hepatitis virus
C; Date: 31-Mar-1989 #sequence_revision 31-Mar-1989 #text_change 09-Jul-2004
C; Accession: 128948
